Theorem

In three-player SCAR, for any starting state s we have

$$\forall i \in I, \forall \sigma^i : Q_s^i(\pi^1, \pi^2, \pi^3) \geq Q_s^i(\sigma^i, \pi^{-i}). \quad (1)$$

In other words, $\pi = (\pi^1, \pi^2, \pi^3)$ is a Nash equilibrium for three-player SCAR with any starting state s .

The threat strategy of player i is denoted by π^i and defined as follows:

- 1 as long as every player $j \neq i$ follows ϕ_j^j , player i follows ϕ_i^i ;
- 2 as soon as some player $j \neq i$ deviates from ϕ_j^j , player i switches to ϕ_j^i and uses it for the rest of the game.

Note that:

- If player j deviates then the players in $I \setminus \{j\}$ play the *coalition strategy* optimal against j in $\Gamma_s(j)$.
- The deviation will be detected immediately, since the game has perfect information.

Remarks

- 1 $\pi = (\pi^1, \pi^2, \pi^3)$ is a NE iff (for every i) player i has no incentive to *unilaterally* deviate from strategy π^i .

N -player SCAR

Conjectures etc.

Concurrent Cops and
Robbers

- The game is played between two cops; each tries to capture the robber first.
- The robber is passive: his moves are given by a fixed function, known in advance to the cops.
- We only examine graphs with $c(G) = 1$.
